Part 1: Please use **formal logic** to finish the following 4 exercises. (100 points)

Exercise 1: Write the negation of each statement (10 points)

- (1) The processor is fast but the printer is slow.
- (2) The processor is fast or else the printer is slow.
- (3) If the processor is fast, then the printer is slow.
- (4) Either the processor is fast and the printer is slow, or else the file is damaged.
- (5) The printer is slow only if the file is damaged.

Note: (3) and (5) rely on the fact that $A \rightarrow B \leftrightarrow A' \vee B$ (Implication rule).
 so $(A \rightarrow B)' \leftrightarrow (A' \vee B)'$, $(A \rightarrow B)' \leftrightarrow A \wedge B'$ by De Morgan's law

- (1) The processor is slow or the printer is fast.
- (2) The processor is slow and the printer is fast.
- (3) The processor is fast and the printer is fast.
- (4) The processor is slow or the printer is fast, and the file is not damaged.
- (5) The printer is slow and the file is not damaged.

In []:

Exercise 2: Construct truth tables for the following wffs. Note any tautologies or contradictions (56 points)

- (a) $(A \rightarrow B) \leftrightarrow A' \vee B$
- (b) $(A \wedge B)' \leftrightarrow A' \vee B'$

- (a) Truth table for $(A \rightarrow B) \leftrightarrow A' \vee B$

A	B	$A \rightarrow B$	A'	$A' \vee B$	$(A \rightarrow B) \leftrightarrow A' \vee B$
T	T	T	F	T	T
T	F	F	F	F	T
F	T	T	T	T	T
F	F	T	T	T	T

(b) Truth table for $(A \wedge B)' \leftrightarrow A' \vee B'$

A	B	$A \wedge B$	$(A \wedge B)'$	A'	B'	$A' \vee B'$	$(A \wedge B)' \leftrightarrow A' \vee B'$
T	T	T	F	F	F	F	T
T	F	F	T	F	T	T	T
F	T	F	T	T	F	T	T
F	F	F	T	T	T	T	T

In []:

Exercise 3: Use a proof sequence to prove that the following argument is valid. (20 points)

$(A \rightarrow B) \wedge [B \rightarrow (C \rightarrow D)] \wedge [A \rightarrow (B \rightarrow C)] \rightarrow (A \rightarrow D)$

Proof:

1. $A \rightarrow B$ (hypothesis)
2. $B \rightarrow (C \rightarrow D)$ (hypothesis)
3. $A \rightarrow (B \rightarrow C)$ (hypothesis)
4. A (hypothesis)
5. B (1,4 mp)
6. $C \rightarrow D$ (2,5 mp)
7. $B \rightarrow C$ (3,4 mp)
8. C (5,7 mp)
9. D (6,8 mp)

Exercise 4: Write the following argument using propositional wffs, then prove that the argument is valid using a proof sequence. (14 points)

If DeWayne is not tall, then Jayden is not DeWayne's brother. If DeWayne is tall, then Trevor is DeWayne's brother. Therefore, if Jayden is DeWayne's brother, then Trevor is DeWayne's brother.

You can use D,J,T as the statement letters

D: DeWayne is tall.

J: Jayden is DeWayne's brother

T: Trevor is DeWayne's brother

Proposition Logic: $(D' \rightarrow J') \wedge (D \rightarrow T) \rightarrow (J \rightarrow T)$

Proof:

1. $D' \rightarrow J'$ (hypothesis)
2. $D \rightarrow J$ (hypothesis)
3. J (hypothesis)
4. D (1,3 mt)

5. T (2,4 mp)

In []:

Part 2: Please use **Proofs, Induction** to finish the following 6 exercises. (100 points)

Exercise 1: Provide a **counter example to the following statement: (4 points)**

The number n is an odd integer if and only if $3n + 5$ is an even integer.

This is actually the statement: (If n is an odd integer then $3n + 5$ is an even integer) AND (If $3n + 5$ is an even integer, then n is an odd integer)

Let $3n + 5 = 6$ (note doing a counter example is the ONLY time you can pick a specific test case)
Then $3n = 1$ which means $n = 1/3$ (but $1/3$ is NOT an odd integer... it isn't even an integer)

In []:

Exercise 2: Please prove the following statement using **exhaustive proof. (16 points)**

For $2 \leq n \leq 4$, $n^2 \geq 2^n$

n	n^2	2^n	$n^2 \geq 2^n$
2	4	4	yes
3	9	8	yes
4	16	16	yes

In []:

Exercise 3: Please prove the following statement using **direct proof (10 points)**

The sum of an even integer and an odd integer is odd.

Rewrite mathematically: If x is even and y is odd, then $x + y$ is odd.

1. $x = 2m$ (hypothesis)
2. $y = 2n + 1$ (hypothesis)
3. $x + y = 2m + 2n + 1$ (substitution)
4. $x + y = 2(m+n) + 1$ (algebra)

In []:

Exercise 4: Please prove the following statement using **proof by contradiction. (10 points)**

If $x^2 + 2x - 3 = 0$, then $x \neq 2$

1. $x^2 + 2x - 3 = 0$ (hypothesis)
2. $x = 2$ (hypothesis)
3. $2^2 + 2 \cdot 2 - 3 = 0$ (substitution)
4. $4 + 4 - 3 = 0$ (contradiction)

Exercise 5: For all positive integers, let $P(n)$ be the equation. (16 points)

$$2 + 4 + 6 + \dots + 2n = n(n + 1)$$

- a. Write the equation for the base case $P(1)$ and verify that it is true.
- b. Write the inductive hypothesis $P(k)$
- c. Write the equation for $P(k + 1)$
- d. Prove that $P(k + 1)$ is true given b

- (a) $P(1)$ is $2 = 1(1+1)$ since that is $2=2$ it's true
- (b) $2 + 4 + 6 + \dots + 2k = k(k+1)$ (hypothesis)
- (c) $2 + 4 + 6 + \dots + 2(k+1) = (k+1)((k+1)+1)$
- (d) $2 + 4 + 6 + \dots + 2k + 2(k+1) = k(k+1) + 2(k+1)$ (1, algebra)
 $2 + 4 + 6 + \dots + 2(k+1) = (k+1)(k+2) = (k+1)((k+1)+1)$ (2, algebra)

In []:

Exercise 6: Please prove the following statements are true for every positive integer n using **mathematical induction. (44 points)**

$$(1) \quad 2 + 6 + 18 + \dots + 2 \times 3^{n-1} = 3^n - 1$$

$$(2) 1 \times 2^1 + 2 \times 2^2 + 3 \times 2^3 + \dots + n \times 2^n = (n-1) \times 2^{n+1} + 2$$

(1) Basis: Show P(1) is true

on the left side the end number in the series is $2 \times 3^{1-1}$ which is $2 \times 3^0 = 2 \times 1 = 2$

on the right side: $3^1 - 1 = 2$ We prove that P(1) is true

Induction: Show P(k) \rightarrow P(k+1) (16 points)

1. $2 + 6 + 18 + \dots + 2 \times 3^{k-1} = 3^k - 1$ (Hypothesis)
2. $2 + 6 + 18 + \dots + 2 \times 3^{k-1} + 2 \times 3^k = 3^k - 1 + 2 \times 3^k$ (1, algebra)
3. $2 + 6 + 18 + \dots + 2 \times 3^k = 3 \times 3^k - 1$ (2, algebra)
because $x + 2x$ is $3x$ and here x is 3^k
4. $2 + 6 + 18 + \dots + 2 \times 3^k = 3^{k+1} - 1$ (3, algebra)

In []:

(2) Basis: Show P(1) is true

on the left side the first number in the series is $1 \times 2^1 = 2$

on the right side: $(1-1) \times 2^{1+1} + 2 = 2$

We prove that P(1) is true

Induction: Show P(k) \rightarrow P(k+1) (16 points)

1. $1 \times 2^1 + 2 \times 2^2 + 3 \times 2^3 + \dots + k \times 2^k = (k-1) \times 2^{k+1} + 2$ (Hypothesis)
2.
 $1 \times 2^1 + 2 \times 2^2 + 3 \times 2^3 + \dots + k \times 2^k + (k+1) \times 2^{k+1} = (k-1) \times 2^{k+1} + 2 + (k+1) \times 2^{k+1}$
(1, algebra)
3. $1 \times 2^1 + 2 \times 2^2 + 3 \times 2^3 + \dots + (k+1) \times 2^{k+1} = (k-1) \times 2^{k+1} + 2 + (k+1) \times 2^{k+1}$ (2, algebra)
4.
 $1 \times 2^1 + 2 \times 2^2 + 3 \times 2^3 + \dots + (k+1) \times 2^{k+1} = k \times 2^{k+1} - 2^{k+1} + 2 + k \times 2^{k+1} + 2^{k+1}$
(3, algebra)
 $= 2k \times 2^{k+1} + 2$
 $= k \times 2^{k+1+1} + 2$
 $= ((k+1) - 1) 2^{k+1+1} + 2$
